### Contents

✤ 2.5.1 Reciprocal & Rational Functions

## 2.5.1 Reciprocal & Rational Functions

### **Reciprocal Functions & Graphs**

#### What is the reciprocal function?

• The **reciprocal function** is defined by  $f(x) = \frac{1}{x}, x \neq 0$ 

- Its domain is the set of all real values except 0
- Its range is the set of all real values except 0
- The reciprocal function has a **self-inverse** nature
  - $f^{-1}(x) = f(x)$
  - $(f \circ f)(x) = x$

#### What are the key features of the reciprocal graph?

- The graph does not have a y-intercept
- The graph does not have any roots
- The graph has two asymptotes
  - A horizontal asymptote at the x-axis: y=0
    - This is the **limiting value** when the absolute value of x gets very large
  - A vertical asymptote at the y-axis: x = 0
    - This is the value that causes the denominator to be zero
- The graph has two axes of symmetry
  - y = x
  - y = -x
- The graph does not have any minimum or maximum points

## Linear Rational Functions & Graphs

#### What is a rational function with linear terms?

- A (linear) rational function is of the form  $f(x) = \frac{ax+b}{cx+d}, x \neq -\frac{d}{c}$
- Its domain is the set of all real values except  $-\frac{d}{c}$
- Its range is the set of all real values except
- The reciprocal function is a special case of a rational function

#### What are the key features of linear rational graphs?

- The graph has a *y*-intercept at \$\left(0, \frac{b}{d}\right)\$ provided \$d \neq 0\$
  The graph has one root at \$\left(-\frac{b}{a}, 0\right)\$ provided \$a \neq 0\$
- The graph has two asymptotes
  - A horizontal asymptote:  $y = \frac{a}{c}$ 
    - This is the **limiting value** when the absolute value of *x* gets very large
  - A vertical asymptote:  $x = -\frac{d}{c}$ 
    - This is the value that causes the **denominator to be zero**
- The graph **does not have any minimum or maximum points**
- If you are asked to **sketch or draw** a rational graph:
  - Give the **coordinates** of any **intercepts** with the axes
    - Give the equations of the asymptotes

### 😧 Examiner Tip

- If you draw a horizontal line anywhere it should only intersect this type of graph once at most
- The only horizontal line that should not intersect the graph is the horizontal asymptote
  - This can be used to check your sketch in an exam

## **Quadratic Rational Functions & Graphs**

How do I sketch the graph of a rational function where the terms are not linear?

- A rational function can be written  $f(x) = \frac{g(x)}{h(x)}$ 
  - Where g and h are polynomials
- To find the **y-intercept** evaluate  $\frac{g(0)}{h(0)}$
- To find the x-intercept(s) solve g(x) = 0
- To find the equations of the vertical asymptote(s) solve h(x) = 0
- There will also be an **asymptote** determined by what *f*(*x*) tends to as *x* approaches infinity
  - In this course it will be either:
    - Horizontal
    - Oblique (a slanted line)
  - This can be found by writing g(x) in the form h(x)Q(x) + r(x)
    - You can do this by polynomial division or comparing coefficients
  - The function then tends to the curve y = Q(x)

#### What are the key features of rational graphs: quadratic over linear?

- For the rational function of the form  $f(x) = \frac{ax^2 + bx + c}{dx + c}$
- The graph has a *y*-intercept at  $\left(0, \frac{c}{c}\right)$  provided  $c \neq 0$
- The graph can have **0**, **1 or 2 roots** 
  - They are the solutions to  $ax^2 + bx + c = 0$
- The graph has one vertical asymptote  $x = -\frac{e}{d}$
- The graph has an **oblique asymptote** y = px + q
  - Which can be found by writing  $ax^2 + bx + c$  in the form (dx + e)(px + q) + r
    - Where *p*, *q*, *r* are constants
    - This can be done by **polynomial division** or **comparing coefficients**

#### What are the key features of rational graphs: linear over quadratic?

- For the rational function of the form  $f(x) = \frac{ax+b}{cx^2+dx+e}$
- The graph has a **y-intercept** at  $\left(0, \frac{b}{e}\right)$  provided  $e \neq 0$
- The graph has **one root** at  $x = -\frac{b}{a}$
- The graph has can have **0**, **1** or **2** vertical asymptotes
  - They are the solutions to  $cx^2 + dx + c = 0$
- The graph has a **horizontal asymptote**

- If you draw a horizontal line anywhere it should only intersect this type of graph twice at most
  - This idea can be used to check your graph or help you sketch it
