Easy Questions

1 (a)	_		a rope and a pl circular path.	erson swings th	ne bung aroun	d their head. The bung
	Circle four circle.	options fro	om the list belo	ow, which are pr	operties of all	objects moving in a
		Period	Heat energy	Electricity	Frequency	Decay constant
		Angular d	isplacement	Capacitance	Angular spe	ed Strangeness
						(4 marks
(b)	The length force <i>F</i> .	of the rop	e is r , and the $\mathfrak k$	oung is moving v	with velocity <i>v</i> .	It is acted upon by
	Sketch the	shape of t	he bung's path	, labelling <i>r</i> , <i>v</i> ar	nd <i>F</i> .	
						(3 marks
(c)	The bung t	travels tho	ugh an angular	displacement o	f $\frac{\pi}{8}$ rad.	
	Convert th	ie angular (displacement ir	nto degrees.		

			(3 marks)
(d)	It takes 0.5 0.75 m.	5 s for the bung to complete one revolution. The radius of its cire	cular path is
	(i)	Calculate the angular speed of the bung.	
	(ii)	Calculate the linear speed of the bung.	[4]
			[2]
			(6 marks)

2 (a)	A car is mo	oving with uniform circular motion and experiences a centripetal force	•
	(i)	Define centripetal force.	
	(ii)	State the type of force which is responsible for the centripetal force car.	[3] on the
			[1]
		(4	marks)
(b)		as mass 500 kg and is travelling around a roundabout with a linear spec e radius of the roundabout is 12 m.	ed of 9
	Determine	e the centripetal force acting on the car.	
		(2	marks)
(c)	•	roceeds to another roundabout which has radius 20 m. The angular spethis roundabout is $0.2~{ m rad~s^{-1}}$.	eed of
	Calculate t	the centripetal acceleration of the car around this roundabout.	
		(3	marks)
(d)		cond roundabout, the car is travelling at the maximum speed possible ld. The coefficient of static friction determines the maximum speed pos	

is given by $\mu_s = \frac{\omega^2 r}{g}$, where ω is the angular speed, r is the radius of the root	undabout,
and g is the acceleration due to gravity.	
Determine the co-efficient of static friction between the tyres and the road.	
	(2 marks)

	(i) State the angular displacement of the planet in 260 days, giving ar appropriate unit with your answer.	1
	(i) Calculate the angular speed of the planet.	[2]
	(i) Calculate the angular speed of the planet.	[4]
		(6 marks)
(b)	The linear speed of the planet is $35000\mathrm{ms^{-1}}$.	
	Calculate the radius of the planet's orbit.	
		(2 marks)
, ,	TI I I I I I I I I I I I I I I I I I I	
(c)	The planet has a mass of 2.7×10^{24} kg and stays in orbit due to a centripetal for	orce.
(c)	The planet has a mass of 2.7×10^{24} kg and stays in orbit due to a centripetal for Calculate the centripetal force required to keep the planet in orbit.	orce.
(c)		
(c)		

3 (a) A planet orbits a star in 260 Earth days, which is 22 464 000 s.

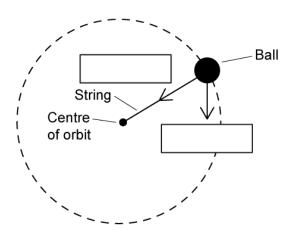

(d)	The planet	experiences a centripetal acceleration.	
	(i)	Define uniform centripetal acceleration	[3]
	(ii)	Determine the centripetal acceleration experienced by the planet.	
			(5 marks)

4 (a)	A fairgrou	and ride is moving with uniform circular motion.	
	(i)	Define angular displacement.	121
	(ii)	Define angular speed.	[2]
			[1]
			(3 marks)
(b)	A child on s^{-1} .	the ride has an angular displacement of $\frac{\pi}{2}$ rad and angular speed	d of 0.3 rad
	Calculate	the time required for the child to have this angular displacement.	
			(4 marks)
(c)	The radius	s of the ride is 8 m and the child's mass is 35 kg.	
(-)		e the centripetal force on the child.	
	Beterriii	e the centripetar force on the china.	
			(2 marks)

(d)		(i)	Calculate the child's linear speed.	
				[2]
		(ii)	Calculate the child's centripetal acceleration.	
				[2]

			(4 mar	_

- **5 (a)** The diagram shows the bath of a ball with two forces acting on it. The ball is attached to a string and is swung in a circle in a vertical plane. Air resistance is negligible.
 - (i) Label the forces marked on the diagram below:

(ii) State which of these forces provides the centripetal force on the ball.

[2]

[1]

(3 marks)

(b) The centripetal force on the ball is not constant as the ball travels along its circular path.

Circle the correct words in the sentences below:

The **maximum / minimum** magnitude of centripetal force is found at the bottom of the circular path.

The **maximum / minimum** magnitude of centripetal force is found at the top of the circlular path.

(2 marks)

(c)	The radius of the circle is 0.8 m, the mass of the ball is 0.5 kg and the linear velocity is 2.4 m s $^{-1}$.
	Calculate the centripetal force at the bottom of its circular path.
	(3 marks)
(d)	The speed and acceleration of the ball varies as it moves around its circular path.
	Circle the correct words in the sentences below:
	The speed of the ball at the bottom of the circular path will be faster / slower than at the top.
	The acceleration at the bottom of the circular path will be at a minimum / maximum compared to the top.
	(2 marks)

Medium Questions

1 (a)	A lead ball of mass 0.55 kg is swung round on the end of a string so that the ball move in a horizontal circle of radius 1.5 m. The ball travels at a constant speed of 6.2 m s ^{-1} .	:S
	Calculate the time taken for the string to turn through an angle of 170°.	
	(3 mar	ks)
(b)	Calculate the tension in the string.	
	(2 mar	ks)
(c)	The string will break when the tension exceeds a maximum tension. The ball makes three revolutions per second at the maximum tension of the string.	
	Calculate the tension above which the string will break.	
	(2 mar	ks)
(d)	Describe, using just one of Newton's Laws, why the ball is accelerating even when its angular speed is constant.	
	You may wish to draw a diagram to clarify your answer.	

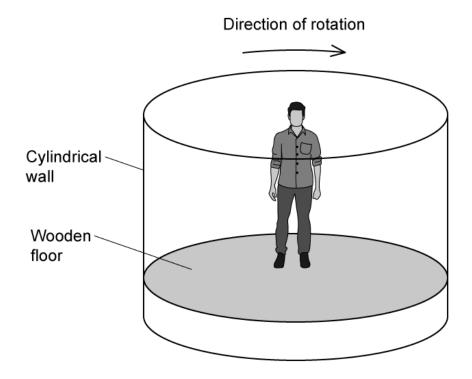

(3 marks)

2 (a) Explain why a particle moving in a circle with uniform speed is accelerating.

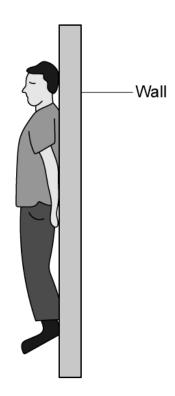

(2 marks)

(b) The diagram shows a fairground ride called a Rotor. Riders stand on a wooden floor and lean against the cylindrical wall.

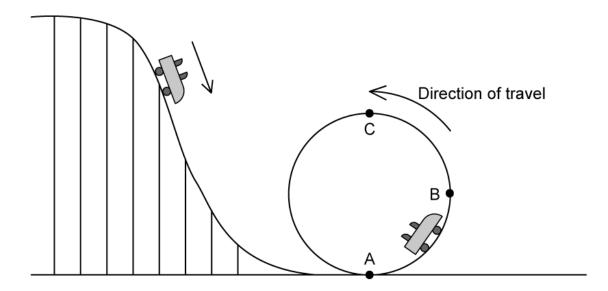

The fairground ride is then rotated. When the ride is rotating sufficiently quickly the wooden floor is lowered. The riders remain pinned to the wall by the effects of the motion. When the speed of rotation is reduced, the riders slide down the wall and land on the floor.

At the instant shown in below the ride is rotating quickly enough to hold a rider at a constant height when the floor has been lowered.

	(2 marks
c)	A rotor accelerates uniformly from rest to maximum angular velocity of 3.6 rads s ⁻¹ . At the maximum speed the centripetal acceleration is 35 m s ⁻² .
	Calculate the diameter of the rotor.

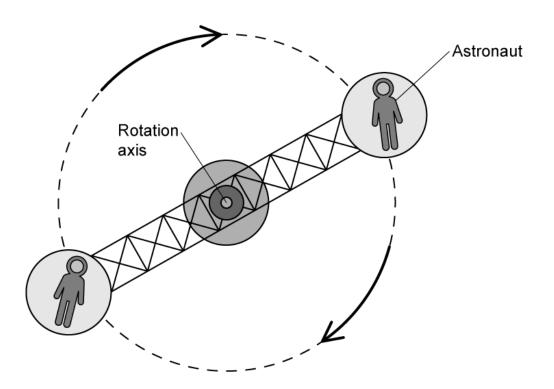

(d) The diagram shows the final section of a roller coaster which ends in a vertical loop. Cars on the roller coaster descend to the start of the loop and then travel around it.

As the passengers move around the circle from ${\bf A}$ to ${\bf B}$ to ${\bf C}$, the reaction force between exerted by their seat varies.

State the position at which this force will be a maximum and the position at which it will be a minimum. Explain your answers.	
(4 marks))

3 (a) A centrifuge is often used in astronaut training. This is to simulate Earth's gravity on board the space station. The astronauts sit in a cockpit at the end of each arm, each rotating about an axis at the centre.

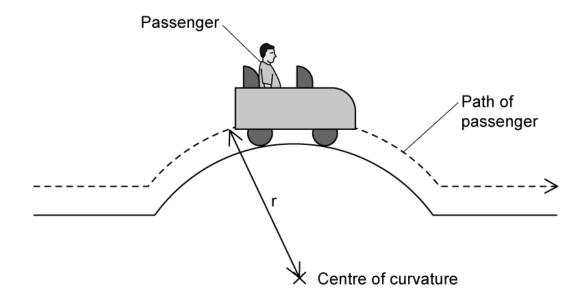

At its top speed, the centrifuge makes 1 full rotation every 2.30 s.

		(2 marks)
(6)		
(b)	Calculate the angular speed of the centrifuge in rad s^{-1} .	
		(3 marks)
	Calculate the frequency of the centrifuge. State an appropriate unit answer to an appropriate number of significant figures.	and express your

		(1 mark)
(d)	Sketch the direction of the acceleration on each astronaut.	
		(2 marks)
	calculate the magnitude of the centripetal acceleration of each astronaut.	
	Calculate the magnitude of the centripetal acceleration on each astronaut.	
(c)	Each astronaut is placed 6.30 m from the rotation axis.	

4 (a) A section of a roller coaster carries a passenger over a curve in the track. The radius of curvature of the path of the passenger is *r* and the roller coaster is travelling at constant speed v. The mass of the passenger is m.

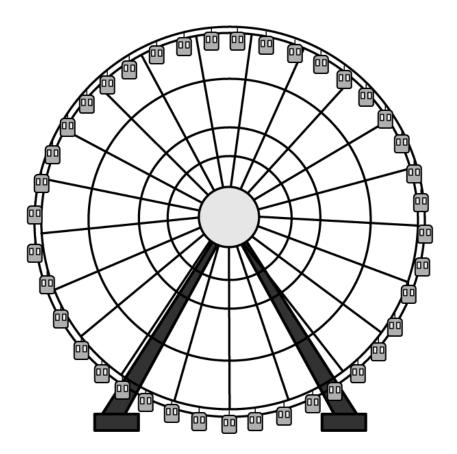

- (i) Draw the forces that act on the passenger as they pass over the highest point on the curved track.
- (ii) Write down an equation that relates the contact force *R* between the passenger and the seat to m, v, r and the gravitational field strength, g.

(2 marks)

(D)	reaction force between the car and the track at this point is 210 N and the passenger has a mass of 65 kg.
	Calculate the distance from the passenger to the centre of curvature of the curved track.
	(3 marks)
(c)	State and explain what would happen to the magnitude of <i>R</i> if the rollercoaster passed over the curved track at a higher speed.
	(2 marks)
(d)	When the rollercoaster passes over a curved section of a track above a certain speed, the passenger is momentarily lifted off their seat and experiences weightlessness.
	Calculate the speed at which the rollercoaster must be travelling for the passenger to experience weightlessness.
	(3 marks)

5 (a) The London Eye shown in the diagram has a radius of approximately 68 m and the passengers in the capsules travel at an angular speed of $3.5 \times 10^{-3} \text{ rad s}^{-1}$.

Calculate the speed of each passenger in the capsules.

	(2 marks)

(b) Assume the London Eye is rotating clockwise.

Sketch the following on any capsule:

- The direction of the centripetal force F(i)
- (ii) The direction of the linear speed *v*.

(2 marks)

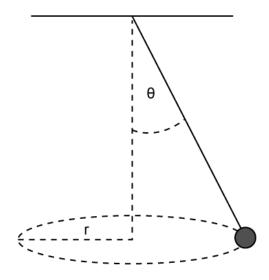

(c)	Each capsule weighs about 98.1 kN.
	Calculate the centripetal force on an empty capsule.
	(3 marks)
(d)	Dan has travelled to London to watch an exciting Physics show. Being an eager tourist, he arrives early and plans to ride the London Eye. When he gets to the front of the queue however, he realises he only had 40 minutes before he needs to leave for the show.
	State, with a calculation, whether Dan is still able to ride the London Eye and leave to see the show on time.
	(4 marks)

Hard Questions

1 (a)	A proton of mass m moves with uniform circular motion. Its kinetic energy is K and its orbital period is T .
	Show that the orbital radius <i>r</i> is given by:
	$r = \sqrt{\frac{KT^2}{2\pi^2 m}}$
	(2 marks)
(b)	The proton moves in a clockwise circle of circumference 1.25 mm. The net force on the proton is 65 fN.
	Determine the linear speed of the proton.
	(3 marks)
(c)	Calculate the proton's orbital frequency.
	(3 marks)

(d)	(i)	State the mechanism by which protons are made to travel in circular paths.	
			1]
	(ii)	Comment on the work done on the proton by this mechanism.	
			2]
			_
		(3 marks	5)

2 (a) A small ball is attached to a string and moves in a horizontal circular path. It completes one revolution every 2.5 s, with the string at an angle θ to the vertical.

Calculate the orbital radius r if $\theta = 12^{\circ}$.

You may wish to use the following data:

$$\tan \theta = \frac{\sin \theta}{\cos \theta}$$

(3 marks)

(b) Show that the length of the string *l* is given by:

$$l = \frac{g}{\omega^2 \cos \theta}$$

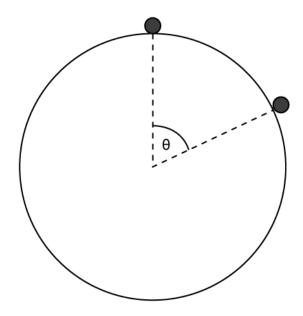

You may wish to use the following data:

$$\tan \theta = \frac{\sin \theta}{\cos \theta}$$

	(2 marks)
(c)	The equation in part (b) seems to suggest that the length of the string $\it l$ is dependent on the angle it makes to the vertical, $\it \theta$.
	Comment on the relationship between the length of the string $\it l$ and the angle it makes to the vertical, $\it \theta.$
	(2 marks)

3 (a) A marble rolls from the top of a bowling ball of radius *R*.

Show that when the marble has moved so that the line joining it to the centre of the sphere subtends an angle of θ to the vertical, its speed v is given by:

$$v = \sqrt{2gR(1 - \cos\theta)}$$

(3 marks)

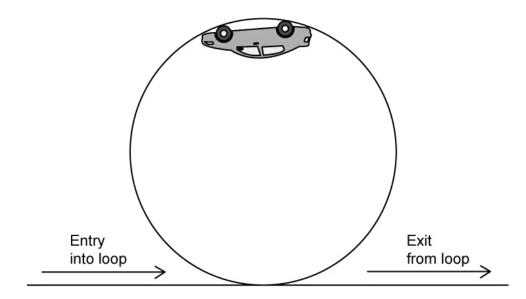

(b) Deduce that, at the instant shown in the image in part (a), the normal reaction force *N* on the marble from the bowling ball is given by:

$$N = mg(3\cos\theta - 2)$$

(4 marks)

(c)	Hence, determine the angle θ at which the marble loses contact with the bowling ball.
(C)	rience, determine the angle o at which the marble loses contact with the bowling ball.
	(2 marks)

4 (a) The 'loop-the-loop' is a popular ride at amusement parks, involving passengers in cars travelling in a vertical circle.

The loop has a radius of 8.0~m and a passenger of mass 70~kg travels at $10~\text{m}~\text{s}^{-1}$ when at the highest point of the loop.

Calculate, at the highest point:

(i)	the centripetal acceleration of the passenger,	
		[1]

(ii) the force that the seat exerts on the passenger.

[2]

(3 marks)

(b) Stating any assumptions required, calculate the speed of the passenger at the point marked 'exit from loop' in part (a).

		(3 marks)
(c)	Operators must ensure that the speed of the vehicle carrying passengers into the-loop is above a certain value.	the loop-
	Suggest a reason for this, and determine the minimum required speed.	
		(2 marks)

5 (a)	A popular trick to impress young observers is to swing a bucket of water in a vertical circle. If the bucket is swung fast enough, no water spills out.
	Estimate the minimum linear speed ν required to swing a bucket in a vertical circle, such that no water spills.
	(3 marks)
(b)	When the bucket of water is stirred with a spoon in uniform circular motion near the rim, the level of water in the bucket is observed to change from a flat horizontal dashed line to a curved solid line, as shown.
	Bucket Flat water surface Curved water surface By considering the circular motion of a fluid particle in the water, explain this observation using relevant physical principles.
