3.7 Inverse & Reciprocal Trig Functions

Contents

3.7.1 Reciprocal Trig Functions

Reciprocal Trig Functions

What are the reciprocal trig functions?

- There are three reciprocal trig functions that each correspond to either sin, cos or tan
  - Secant (sec x)
    - $\sec x = \dfrac{1}{\cos x}$
  - Cosecant (cosec x)
    - $\operatorname{cosec} x = \dfrac{1}{\sin x}$
  - Cotangent (cot x)
    - $\cot x = \dfrac{1}{\tan x}$
  - The identities above for sec x and cosec x are given in the formula booklet
  - The identity for cot x is **not given**, you will need to remember it
  - A good way to remember which function is which is to look at the **third** letter in each of the reciprocal trig functions
    - co**t** x is 1 over **t**an x etc
- Each of the reciprocal trig functions are undefined for certain values of x
  - sec x is undefined for values of x for which cos $x = 0$
  - cosec x is undefined for values of x for which sin $x = 0$
  - cot x is undefined for values of x for which tan $x = 0$
    - When tan x is undefined, cot $x = 0$
- Rearranging the identity $\tan x = \dfrac{\sin x}{\cos x}$ gives
  - $\cot x = \dfrac{\cos x}{\sin x}$
    - This is not in the formula booklet but is easily derived
- Be careful not to confuse the reciprocal trig functions with the inverse trig functions
 - $\sin^{-1} x \neq \dfrac{1}{\sin x}$

What do the graphs of the reciprocal trig functions look like?

- The graph of **$y = \sec x$** has the following properties:
  - *The **y–axis** is a **line of symmetry**
  - It has a **period** of **360°** (**2π** radians)
  - There are vertical **asymptotes** wherever **cos $x = 0$**

Your notes

- If drawing the graph without the help of a GDC it is a good idea to sketch cos *x* first and draw these in
- **The domain** is all *x* **except odd multiples of 90°** (90°, -90°, 270°, -270°, etc.)
  - in **radians** this is all *x* **except odd multiples of π/2** (π/2, - π/2, 3π/2, -3π/2, etc.)
- **The range** is **y ≤ -1 or y ≥ 1**
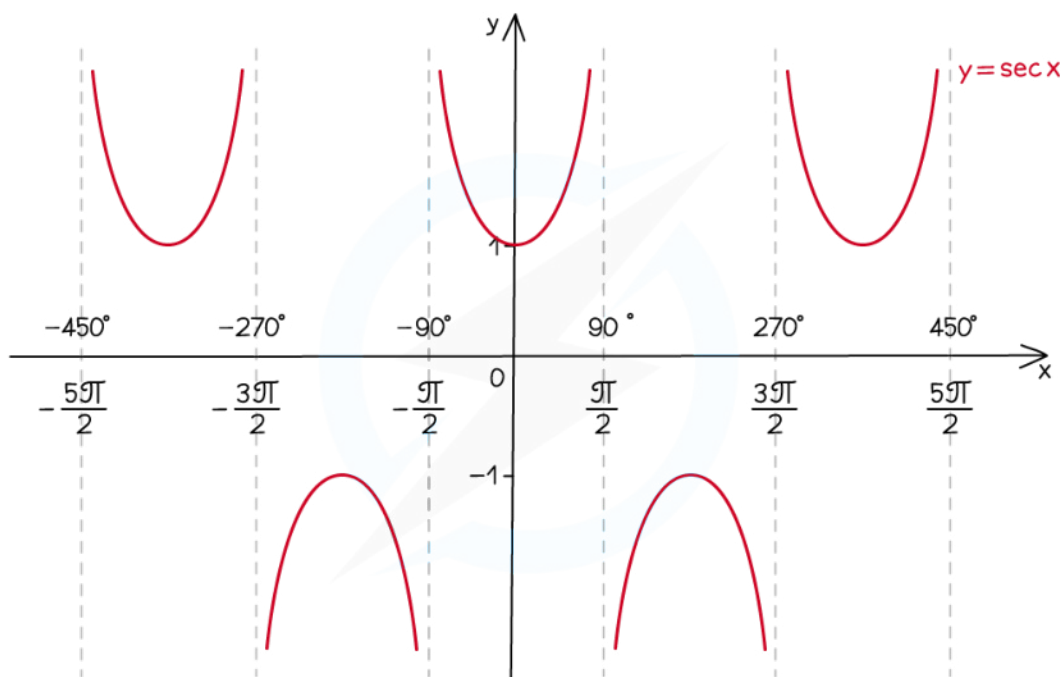

- The graph of **y = cosec x** has the following properties:
  - It has a **period** of **360°** (**2π** radians)
  - There are vertical **asymptotes** wherever **sin x = 0**
    - **If drawing the graph it is a good idea to sketch sin x first and draw these in**
  - The **domain** is all *x* **except multiples of 180°** (0°, 180°, -180°, 360°, -360°, etc.)
    - in radians this is all *x* **except multiples of π** (0, π, - π, 2π, -2π, etc.)
  - The range is *y* ≤ -1 or *y* ≥ 1

Your notes

$y = \mathrm{cosec}\, x$

- The graph of **y = cot x** has the following properties
  - It has a **period** of **180°** or **π** radians
  - There are vertical **asymptotes** wherever **tan x = 0**
  - The **domain** is all *x* **except multiples of 180°** (0°, 180°, –180°, 360°, –360°, etc.)
    - In radians this is all *x* **except multiples of π** (0, π, – π, 2π, –2π, etc.)
  - The **range** is $y \in \mathbb{R}$ (i.e. cot can take *any* real number value)

Your notes
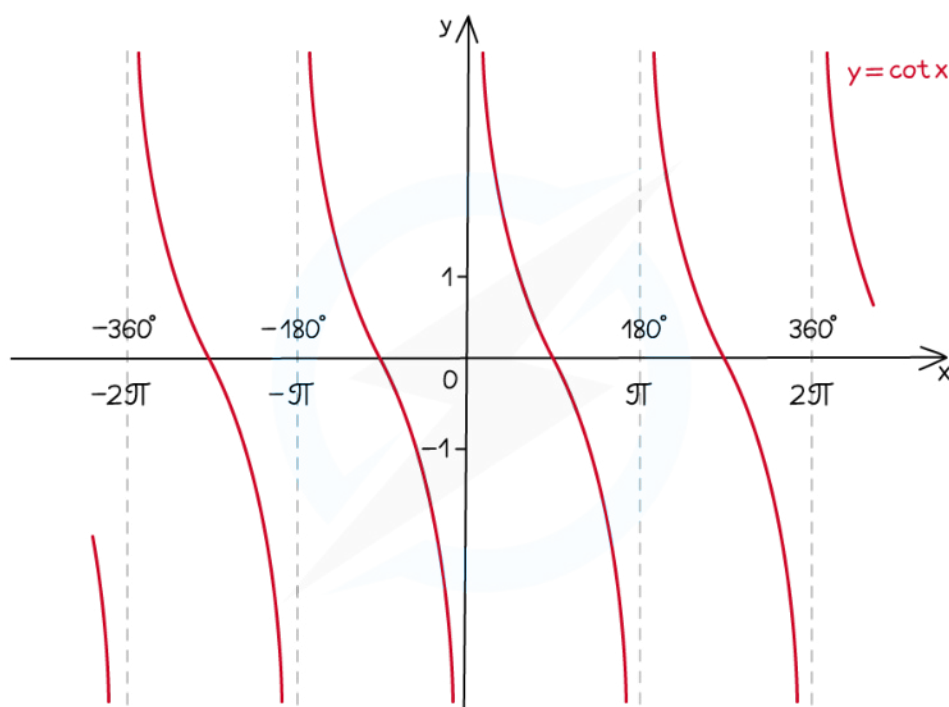

> 🔵 **Examiner Tip**
>
> - To solve equations with the reciprocal trig functions, convert them into the regular trig functions and solve in the usual way
> - Don't forget that both **tan** and **cot** can be written in terms of **sin** and **cos**
> - You will sometimes see **csc** instead of **cosec** for cosecant

---

✏️ **Worked example**

Without the use of a calculator, find the values of

a)

$$\sec \frac{\pi}{6}$$

$$\sec\left(\frac{\pi}{6}\right) = \frac{1}{\cos\left(\frac{\pi}{6}\right)}$$

the third letter
is **c** so sec is related
to **cos**

$cos\left(\frac{\pi}{6}\right)$ is an exact
value you should know.

$$= \frac{1}{\frac{\sqrt{3}}{2}}$$

$$\boxed{\sec\left(\frac{\pi}{6}\right) = \frac{2}{\sqrt{3}}}$$

b) $\cot 45°$

$$\cot 45° = \frac{1}{\tan 45°}$$

the third letter
is **t** so cot is related
to **tan**

$tan 45°$ is an exact
value you should know.

$$= \frac{1}{1}$$

$$\boxed{\cot 45° = 1}$$

Your notes

Pythagorean Identities

What are the Pythagorean Identities?

- Aside from the Pythagorean identity $\sin^2 x + \cos^2 x = 1$ there are two further Pythagorean identities you will need to learn
  - $1 + \tan^2 \theta = \sec^2 \theta$
  - $1 + \cot^2 \theta = \mathrm{cosec}^2 \theta$
    - Both can be found in the formula booklet
- Both of these identities can be derived from $\sin^2 x + \cos^2 x = 1$
  - To derive the identity for **sec²x** divide $\sin^2 x + \cos^2 x = 1$ by **cos²x**
  - To derive the identity for **cosec²x** divide $\sin^2 x + \cos^2 x = 1$ by **sin²x**

$$\sin^2 x + \cos^2 x = 1$$

$$\div \cos^2 x \qquad \div \sin^2 x$$

$$\frac{\sin^2 x}{\cos^2 x} + \frac{\cos^2 x}{\cos^2 x} = \frac{1}{\cos^2 x} \qquad \frac{\sin^2 x}{\sin^2 x} + \frac{\cos^2 x}{\sin^2 x} = \frac{1}{\sin^2 x}$$

$$\tan^2 x + 1 = \sec^2 x \qquad 1 + \cot^2 x = \mathrm{cosec}^2 x$$

> 💡 **Examiner Tip**
>
> All the Pythagorean identities can be found in the **Topic 3: Geometry and Trigonometry** section of the formula booklet

✏️ Worked example

Solve the equation $9\sec^2\theta - 11 = 3\tan\theta$ in the interval $0 \le \theta \le 2\pi$.

$$9\sec^2\theta - 11 = 3\tan\theta, \quad 0 \le \theta \le 2\pi$$

consider how this could be changed to use $\tan^2 + 1 = \sec^2$

Range is given in terms of π so work in radians

$$(9\sec^2\theta - 9) - 2 = 3\tan\theta$$

$$9(\sec^2\theta - 1) - 2 = 3\tan\theta$$

$$9\tan^2\theta - 3\tan\theta - 2 = 0$$

$$(3\tan\theta - 2)(3\tan\theta + 1) = 0$$

$$\tan\theta = \frac{2}{3} \implies \theta = 0.5880\ldots$$

$$\text{or} \quad \theta = \pi + 0.5880\ldots = 3.729\ldots$$

$$\text{or } \tan\theta = -\frac{1}{3} \implies \theta = -0.3217\ldots$$

$$\text{or} \quad \theta = \pi + (-0.3217\ldots) = 2.819\ldots$$

$$\text{and} \quad \theta = 2\pi + (-0.3217\ldots) = 5.961\ldots$$

$$\boxed{\theta = 0.588, \ 2.82, \ 3.73, \ 5.96 \quad (3\text{ s.f.})}$$

3.7.2 Inverse Trig Functions

Inverse Trig Functions

### What are the inverse trig functions?

- The functions **arcsin**, **arccos** and **arctan** are the **inverse functions** of **sin**, **cos** and **tan** respectively when their domains are restricted
  - $\sin(\arcsin x) = x$ for $-1 \le x \le 1$
  - $\cos(\arccos x) = x$ for $-1 \le x \le 1$
  - $\tan(\arctan x) = x$ for all x
- You will have seen and used the inverse trig **operations** many times already
  - Arcsin is the operation $\sin^{-1}$
  - Arccos is the operation $\cos^{-1}$
  - Arctan is the operation $\tan^{-1}$
- The domains of **sin**, **cos**, and **tan** must first be restricted to make them **one-to-one functions**
  - A function can only have an inverse if it is a one-to-one function
- The domain of **sin x** is restricted to **$-\pi/2 \le x \le \pi/2$ ($-90° \le x \le 90°$)**
- The domain of **cos x** is restricted to **$0 \le x \le \pi$ ($0° \le x \le 180°$)**
- The domain of **tan x** is restricted to **$-\pi/2 < x < \pi/2$ ($-90° < x < 90°$)**
- Be aware that $\sin^{-1}x$, $\cos^{-1}x$, and $\tan^{-1}x$ are **not** the same as the reciprocal trig functions
  - They are used to solve trig equations such as $\sin x = 0.5$ for all values of x
  - $\arcsin x$ is the same as $\sin^{-1}x$ but not the same as $(\sin x)^{-1}$

What do the graphs of the inverse trig functions look like?

- The graphs of **arcsin**, **arccos** and **arctan** are the **reflections** of the graphs of **sin**, **cos** and **tan** (after their domains have been restricted) in the line $y = x$
  - The **domains** of $\arcsin x$ and $\arccos x$ are both $-1 \le x \le 1$
 - The **range** of $\arcsin x$ is $-\pi/2 \le y \le \pi/2$

✏️
Your notes
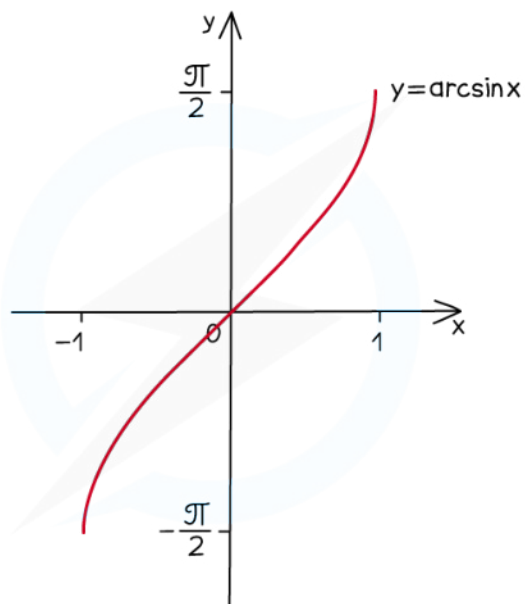

Copyright © Save My Exams. All Rights Reserved

- The **range** of arccos x is $0 \leq y \leq \pi$

Copyright © Save My Exams. All Rights Reserved

- The **domain** of arctan x is $x \in \mathbb{R}$
- The **range** of arctan x is $-\pi/2 < y < \pi/2$
  - Note that there are horizontal asymptotes at $\pi/2$ and $-\pi/2$

Copyright © Save My Exams. All Rights Reserved

How are the inverse trig functions used?

- The functions **arcsin**, **arccos** and **arctan** are used to evaluate trigonometric equations such as $\sin x = 0.5$
  - If $\sin x = 0.5$ then $\arcsin 0.5 = x$ for values of x between $-\pi/2 \leq x \leq \pi/2$
    - You can then use symmetries of the trig function to find solutions over other intervals
- The inverse trig functions are also used to help evaluate algebraic expressions
  - From $\sin(\arcsin x) = x$ we can also say that $\sin^n(\arcsin x) = x^n$ for $-1 \leq x \leq 1$
  - If using an inverse trig function to evaluate an algebraic expression then remember to consider the domain and range of the function
    - $\arcsin(\sin x) = x$ only for $-\pi/2 \leq x \leq \pi/2$
    - $\arccos(\cos x) = x$ only for $0 \leq x \leq \pi$
    - $\arctan(\tan x) = x$ only for $-\pi/2 < x < \pi/2$
  - The symmetries of the trig functions can be used when values lie outside of the domain or range
    - Using $\sin(x) = \sin(\pi - x)$ you get $\arcsin(\sin(2\pi/3)) = \arcsin(\sin(\pi/3)) = \pi/3$

> ### 💡 Examiner Tip
>
> - Make sure you know the shapes of the graphs for **sin**, **cos** and **tan** so that you can easily reflect them in the line $y = x$ and hence sketch the graphs of **arcsin**, **arccos** and **arctan**
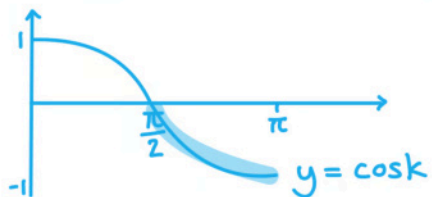

✏️ Worked example

Given that x satisfies the equation $\arccos x = k$ where $\dfrac{\pi}{2} < k < \pi$, state the range of possible values of x.

If $\arccos x = k$, then $x = \cos k$ $(\cos(\arccos x) = x)$

$y = \cos k$

For $\dfrac{\pi}{2} < k < \pi$, $\quad -1 < \cos k < 0$

$$-1 < x < 0$$
