1.10.1 Systems of Linear Equations

Introduction to Systems of Linear Equations

What are systems of linear equations?

- A linear equation is an equation of the first order (**degree 1**)
 - This means that the **maximum degree** of each term is 1
 - These are examples of linear equations:
 - 2x + 3y = 5 & 5x y = 10 + 5z
 - These are examples of non-linear equations:
 - $x^2 + 5x + 3 = 0 & 3x + 2xy 5y = 0$
 - The terms x² and xy have degree 2
- A system of linear equations is where two or more linear equations involve the same variables
 - These are also called **simultaneous equations**
- If there are *n* variables then you will need at least *n* equations in order to solve it
 - For your exam *n* will be 2 or 3
- A **2 × 2 system** of linear equations can be written as
 - $a_1 x + b_1 y = c_1$

$$a_2 x + b_2 y = c_2$$

• A **3 × 3 system** of linear equations can be written as

$$a_1 x + b_1 y + c_1 z = d_1$$

• $a_2 x + b_2 y + c_2 z = d_2$

$$a_3x + b_3y + c_3z = d_3$$

What do systems of linear equations represent?

- The most common application of systems of linear equations is in **geometry**
- For a 2×2 system
 - Each equation will represent a straight line in 2D
 - The solution (if it exists and is unique) will correspond to the coordinates of the point where the two lines intersect
- For a 3×3 system
 - Each equation will represent a **plane in 3D**
 - The solution (if it exists and is unique) will correspond to the **coordinates** of the point where the **three planes intersect**

Page 2 of 12

Systems of Linear Equations

How do I set up a system of linear equations?

- Not all questions will have the equations written out for you
- There will be bits of information given about the variables
 - Two bits of information for a 2×2 system
 - Three bits of information for a 3×3 system
 - Look out for clues such as 'assuming a linear relationship'
- Choose to assign x, y & z to the given variables
 This will be helpful if using a GDC to solve
- Or you can choose to use more meaningful variables if you prefer
 - Such as c for the number of cats and d for the number of dogs

How do I use my GDC to solve a system of linear equations?

- You can use your GDC to solve the system on the calculator papers (paper 2 & paper 3)
- Your GDC will have a function within the algebra menu to solve a system of linear equations
- You will need to choose the number of equations
 - For two equations the variables will be x and y
 - For three equations the variables will be x, y and z
- If required, write the equations in the given form
 - ax+by=c
 - ax + by + cz = d
- Your GDC will display the values of x and y (or x, y, and z)

😧 Examiner Tip

- Make sure that you are familiar with how to use your GDC to solve a system of linear equations because even if you are asked to use an algebraic method and show your working, you can use your GDC to check your final answer
- If a systems of linear equations question is asked on a non-calculator paper, make sure you check your final answer by inputting the values into all original equations to ensure that they satisfy the equations

Worked example

On a mobile phone game, a player can purchase one of three power-ups (fire, ice, electricity) using their points.

- Adam buys 5 fire, 3 ice and 2 electricity power-ups costing a total of 1275 points.
- Alice buys 2 fire, 1 ice and 7 electricity power-ups costing a total of 1795 points.
- Alex buys 1 fire and 1 ice power-ups which in total costs 5 points less than a single electricity power up.

Find the cost of each power-up.

Let x be the cost of a fire power-up
Let y be the cost of an ice power-up
Let z be the cost of an electricity power-up
Form 3 equations

$$5x + 3y + 2z = 1275$$

 $2x + y + 7z = 1795$
 $x + y = z - 5$ $x + y - z = -5$
Write in form $ax + by + cz = d$
Type the 3 equations into the GDC and solve
 $x = 120$, $y = 85$, $z = 210$
Fire costs 120 points
Ice costs 85 points
Electricity costs 210 points

1.10.2 Algebraic Solutions

Row Reduction

How can I write a system of linear equations?

• To save space we can just write the **coefficients without the variables**

• For 2 variables:

$$\begin{array}{c}
a_1 x + b_1 y = c_1 \\
a_2 x + b_2 y = c_2
\end{array}$$
can be written shorthand as
$$\begin{bmatrix}
a_1 & b_1 & c_1 \\
a_2 & b_2 & c_2
\end{bmatrix}$$

$$a_{1}x + b_{1}y + c_{1}z = d_{1} For 3 variables: a_{2}x + b_{2}y + c_{2}z = d_{2} can be written shorthand as \begin{bmatrix} a_{1} & b_{1} & c_{1} & d_{1} \\ a_{2} & b_{2} & c_{2} & d_{2} \\ a_{3} & x + b_{3}y + c_{3}z = d_{3} \end{bmatrix}$$

What is a row reduced system of linear equations?

• A system of linear equations is in row reduced form if it is written as:

$$\begin{bmatrix} A_1 & B_1 & C_1 & D_1 \\ 0 & B_2 & C_2 & D_2 \\ 0 & 0 & C_3 & D_3 \end{bmatrix} \text{ which corresponds to } \begin{array}{c} A_1 x + B_1 y + C_1 z = D_1 \\ B_2 y + C_2 z = D_2 \\ C_3 z = D_3 \end{array}$$

It is very helpful if the values of A₁, B₂, C₃ are equal to 1

What are row operations?

- Row operations are used to make the linear equations simpler to solve
 - They do not affect the solution
- You can switch any two rows

$$\begin{bmatrix} a_1 & b_1 & c_1 & d_1 \\ a_2 & b_2 & c_2 & d_2 \\ a_3 & b_3 & c_3 & d_3 \end{bmatrix} \text{ can be written as } \begin{bmatrix} a_3 & b_3 & c_3 & d_3 \\ a_2 & b_2 & c_2 & d_2 \\ a_1 & b_1 & c_1 & d_1 \end{bmatrix} \text{ using } r_1 \leftrightarrow r_3$$

- This is useful for getting zeros to the bottom
- Or getting a one to the top
- You can multiply any row by a (non-zero) constant

Page 5 of 12

SaveMyExams

.

Your notes

$$\begin{bmatrix} a_1 & b_1 & c_1 & d_1 \\ a_2 & b_2 & c_2 & d_2 \\ a_3 & b_3 & c_3 & d_3 \end{bmatrix} \text{ can be written as } \begin{bmatrix} a_1 & b_1 & c_1 & d_1 \\ ka_2 & kb_2 & kc_2 & kd_2 \\ a_3 & b_3 & c_3 & d_3 \end{bmatrix} \text{ using } k \times r_2 \to r_2$$

• This is useful for getting a l as the first non-zero value in a row

• You can add multiples of a row to another row

$$\begin{bmatrix} a_1 & b_1 & c_1 & d_1 \\ a_2 & b_2 & c_2 & d_2 \\ a_3 & b_3 & c_3 & d_3 \end{bmatrix} \text{ can be written as } \begin{bmatrix} a_1 & b_1 & c_1 & d_1 \\ a_2 + 5a_3 & b_2 + 5b_3 & c_2 + 5c_3 & d_2 + 5d_3 \\ a_3 & b_3 & c_3 & d_3 \end{bmatrix} \text{ using } r_2 + 5r_3 \rightarrow r_2$$

This is useful for creating zeros under a 1

How can I row reduce a system of linear equations?

• STEP 1: Get a 1 in the top left corner

- You can do this by **dividing the row** by the current value in its place
- If the current value is 0 or an awkward number then you can **swap rows first**

$$\bullet \begin{bmatrix} 1 & B_1 & C_1 & D_1 \\ * & * & * & * \\ * & * & * & * \end{bmatrix}$$

- STEP 2: Get 0's in the entries below the 1
 - You can do this by adding/subtracting a multiple of the first row to each row

$$\begin{bmatrix}
1 & B_1 & C_1 & D_1 \\
0 & * & * & * \\
0 & * & * & *
\end{bmatrix}$$

- STEP 3: Ignore the first row and column as they are now complete
 - **Repeat STEPS 1 2** to the remaining section

• Get a 1:
$$\begin{bmatrix} 1 & B_1 & C_1 & D_1 \\ 0 & 1 & C_2 & D_2 \\ 0 & * & * \end{bmatrix}$$

• Then 0 underneath:
$$\begin{bmatrix} 1 & B_1 & C_1 & D_1 \\ 0 & 1 & C_2 & D_2 \\ 0 & 0 & * & * \end{bmatrix}$$

- STEP 4: Get a 1 in the third row
 - Using the same idea as STEP 1

$$\bullet \begin{bmatrix} 1 & B_1 & C_1 & D_1 \\ 0 & 1 & C_2 & D_2 \\ 0 & 0 & 1 & D_3 \end{bmatrix}$$

How do I solve a system of linear equations once it is in row reduced form?

Page 6 of 12

SaveMyExams

• Once you row reduced the equations you can then **convert back to the variables**

$$\begin{bmatrix} 1 & B_1 & C_1 & D_1 \\ 0 & 1 & C_2 & D_2 \\ 0 & 0 & 1 & D_3 \end{bmatrix}$$
 corresponds to $y + C_2 z = D_2$
 $z = D_3$

- Solve the equations starting at the bottom
 - You have the value for *z* from the third equation
 - Substitute z into the second equation and solve for y
 - Substitute z and y into the first each and solve for x

O Examiner Tip

- To reduce the number of operations you do whilst solving a system of operations, you can do a couple of things:
 - You can set up your original matrix with the equations in any order, so if one of the equations already has a 1 in the top left corner, put that one first
 - You do not need to make every equation so that it only has a single variable with a value of 1, you just need to do that for 1 of the equations and use that result to work out the others

Worked example

Solve the following system of linear equations using algebra.

$$2x - 3y + 4z = 14$$

$$x + 2y - 2z = -2$$

$$3x - y - 2z = 10$$
Write without the variables
$$\begin{bmatrix} 2 & -3 & 4 & | 14 \\ 1 & 2 & -2 & | -2 \\ 3 & -1 & -2 & | 10 \end{bmatrix}$$
Swap rows to get 1 in top left corner
$$\begin{bmatrix} 1 & 2 & -2 & | -2 \\ 2 & -3 & 4 & | 14 \\ 3 & -1 & -2 & | 10 \end{bmatrix}$$
Add multiples of R_1 to R_2 and R_3

$$\begin{bmatrix} 1 & 2 & -2 & | -2 \\ 0 & -7 & 8 & | 18 \\ 0 & -7 & 4 & | 16 \end{bmatrix} R_2 - 2R_1 \rightarrow R_2$$
Multiple the second row to get a 1
$$\begin{bmatrix} 1 & 2 & -2 & | -2 \\ 0 & 1 & -8 & | -12 & | 10 \end{bmatrix}$$
Repeat the steps
$$\begin{bmatrix} 1 & 2 & -2 & | -2 \\ 0 & 1 & -8 & | -18 & | \\ 0 & 0 & -4 & | -2 & | R_3 + 7R_2 \rightarrow R_3 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 & -2 & | -2 \\ 0 & 1 & -8 & | -18 & | \\ 0 & 0 & 1 & | -12 & | R_3 + 7R_2 \rightarrow R_3 \end{bmatrix}$$
Write out the equations starting at the bottom
$$z = \frac{1}{2}$$

$$y - \frac{8}{7}z = -\frac{18}{7} \implies y - \frac{4}{7} = -\frac{18}{7} \implies y = -\frac{14}{7} = -2$$

x +2y-2z = -2 => x -4 -1 = -2 => x = 3

x=3, y=-2, $z=\frac{1}{2}$

Your notes

Page 8 of 12

Number of Solutions to a System

How many solutions can a system of linear equations have?

- There could be
 - I unique solution
 - No solutions
 - An infinite number of solutions
- You can determine the case by looking at the row reduced form

How do I know if the system of linear equations has no solutions?

- Systems with **no solutions** are called **inconsistent**
- When trying to solve the system after using the row reduction method you will end up with a mathematical statement which is never true:
 - Such as: 0 = 1
- The row reduced system will contain:
 - At least one row where the entries to the left of the line are zero and the entry on the right of the line is non-zero
 - Such a row is called **inconsistent**
 - For example:

• Row 2 is inconsistent
$$\begin{bmatrix} 1 & B_1 & C_1 & D_1 \\ 0 & 0 & 0 & D_2 \\ 0 & 0 & 1 & D_3 \end{bmatrix}$$
 if D_2 is non-zero

How do I know if the system of linear equations has an infinite number of solutions?

- Systems with **at least one solution** are called **consistent**
 - The solution could be unique or there could be an infinite number of solutions
- When trying to solve the system after using the row reduction method you will end up with a mathematical statement which is always true
 - Such as: 0 = 0
- The row reduced system will contain:
 - At least one row where all the entries are zero
 - No inconsistent rows
 - For example:

$$\left[\begin{array}{cccccccccc} 1 & B_1 & C_1 & D_1 \\ 0 & 1 & C_2 & D_2 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

How do I find the general solution of a dependent system?

• A dependent system of linear equations is one where there are infinite number of solutions

Page 10 of 12

SaveMyExams

- The general solution will depend on **one or two parameters**
- In the case where two rows are zero
 - Let the variables corresponding to the zero rows be equal to the parameters $\lambda \& \mu$
 - For example: If the first and second rows are zero rows then let $x = \lambda \& y = \mu$
 - Find the **third** variable in terms of the two parameters using the equation from the third row
 For example: z = 4λ 5μ + 6
- In the case where only one row is zero
 - Let the variable corresponding to the zero row be equal to the parameter λ
 - For example: If the first row is a zero row then let $x = \lambda$
 - Find the **remaining two variables in terms of the parameter** using the equations formed by the other two rows
 - For example: $y = 3\lambda 5 \& z = 7 2\lambda$

😧 Examiner Tip

- Common questions that pop up in an IB exam include questions with equations of lines
- Being able to recognise whether there are no solutions, 1 solution or infinite solutions is really useful for identifying if lines are coincident, skew or intersect!
